## AIM:

To configure Multi-Factor Authentication (MFA) for an AWS IAM user by registering a passkey, thereby adding an additional authentication method for account sign-in.

## Description:

This experiment demonstrates how to assign a Passkey MFA device to an IAM user in AWS. The user opens the Security credentials page, locates the Multi-factor authentication (MFA) section, and starts the device-assignment process. A passkey is then registered using an available supported device or authenticator. After successful registration, AWS displays a confirmation message indicating that the Passkey MFA device has been assigned. The supplied screenshot shows this successful confirmation for the IAM user named student1.

## Steps:

### Part A: Open the IAM User Security Credentials

1. Sign in to the AWS Management Console using the IAM user account for which MFA must be configured.
2. Open the AWS Management Console and search for **IAM** in the console search bar.
3. In the IAM navigation pane, open **Security credentials** for the currently signed-in IAM user. Alternatively, open the IAM user details and select the Security credentials tab if configuring another user with the required permissions.
4. Confirm that the correct IAM user is selected. In the supplied screenshot, the user name displayed is **student1**.

### Part B: Assign a Passkey MFA Device

5. On the Security credentials page, locate the **Multi-factor authentication (MFA)** section. If the page displays the AWS IAM credentials tab, remain on that tab.
6. Click **Assign MFA device** or the equivalent option shown in the MFA section.
7. Enter a descriptive name for the MFA device when prompted, and choose **Passkey** as the MFA device type.

## Steps (Continued):

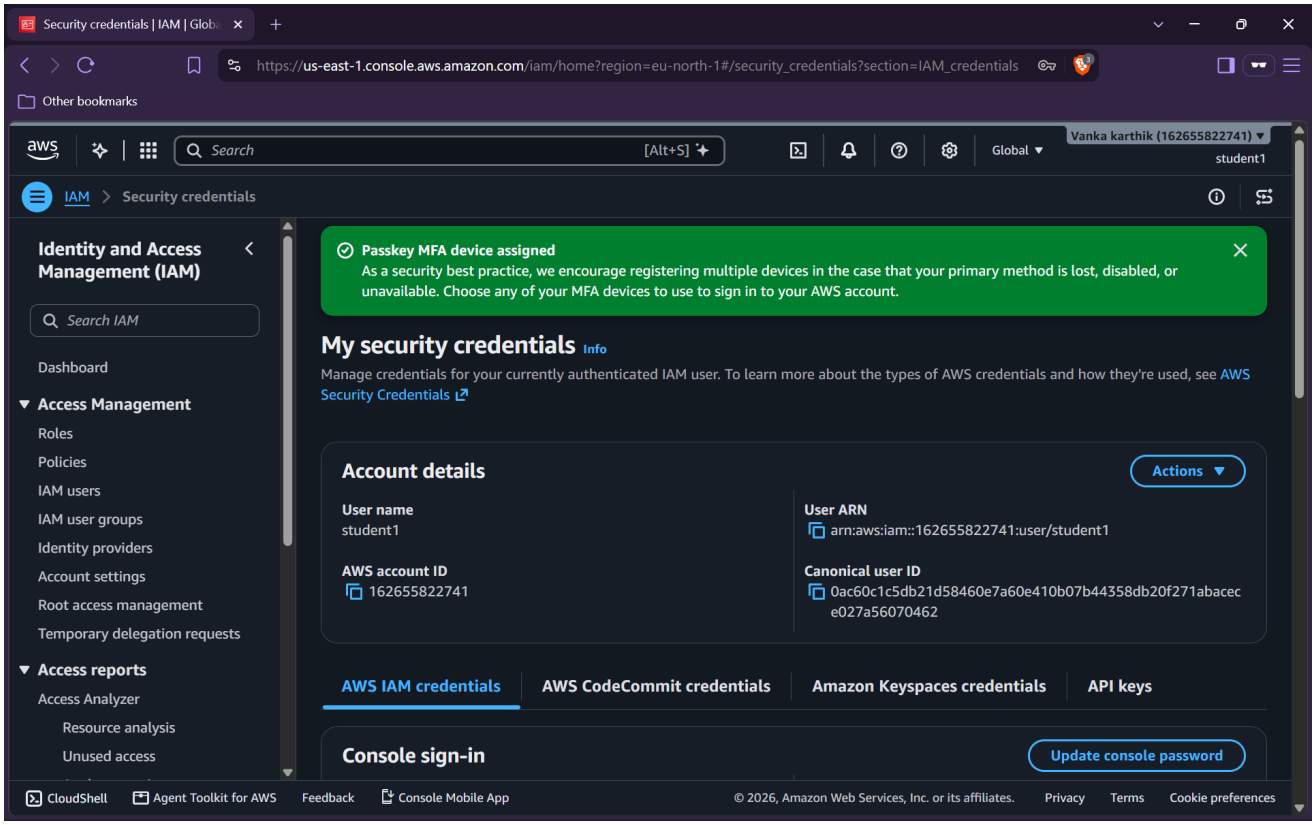

8. Continue to the passkey registration prompt. Follow the instructions displayed by AWS to create or register the passkey using a supported device, such as the device's built-in security feature or a compatible security key.
9. Complete the device authentication or confirmation requested by the browser or operating system. The exact prompt may vary depending on the device and browser being used.
10. Return to the AWS console after the passkey registration is completed. Confirm the assignment when AWS displays the final confirmation step.
11. Verify that AWS displays a success notification stating that the Passkey MFA device has been assigned.
12. Check the MFA section on the Security credentials page to confirm that the passkey is listed as an assigned authentication device.

## Note:

A passkey is not the same as a time-based one-time password (TOTP) code from an authenticator app. This experiment documents the Passkey MFA method shown in the supplied screenshot. Keep access to the registered device secure and register a backup MFA method where appropriate.

## Output:

The AWS Security credentials page displays a green confirmation message stating “Passkey MFA device assigned”. The account details section identifies the IAM user as student1. This confirms that a passkey MFA device was successfully registered for the signed-in IAM user.

*Output Screenshot 1: Successful Passkey MFA device assignment on the AWS IAM Security credentials page.*

**Result:** Multi-Factor Authentication using a passkey was successfully assigned to the IAM user. The AWS console displayed the confirmation message “Passkey MFA device assigned”.
